

Creating water.

There is a heavy short supply of water for the planet in various regions today. this was not the case when the dams were full and the people were few, it is this climate change and such that is seeing our water supply deteriorate. what can we do about it?

If we were to observe that desalination plants are the way to go in coastal cities, then coastal cities, which is a huge chunk of the world's population, would be sought to.

It is the inner regions that need water, and, the best way to supply them with water is to fill the dams or build new ones. if the case is simply refilling the dams, then we could refill the dams by putting a 'filament' in the bottom of the dams that heats up. this would work like a kettle, where instead of having the water escape as water vapor, it would be 'topped off' and then the water vapor would create residue on the 'roof of the dam' and then trickle back down.

To do this we need to 'observe the water cycle.' this follows that sea water evaporates and then makes it's way inland, then makes it's way back to sea. we need to replicate the water cycle in this dam. with the roof, it will form a chamber where the water may be 'created' by 'flood lights,' powered by solar panels, or direct radiation or sunlight focused through a lens to make the water form at the bottom, of course.

Commodities creation.

There are three main commodities i am trying to make - oil, diamonds and gold. it has already come to be that science can make oil, but that must be faulty if they do not do it now, obviously.

If we want to make oil, we need to observe the process first. this would be where the trees die and become coal, and oil is merely liquefied coal. this means we can liquefy coal to make oil but that is a waste. this means we need to find a quick way to make make coal. this is also evident in biofuels, where they grow plants to become oil directly. so, to make oil we need to make coal, and this means we need to dry out plants, obviously. drying the plants could be as simple as heating them, and, this would mean they go all dry like coal. this could stretch to any biological mass, but, what about non biomass? if we were to observe that grass could also become coal, we could have a ho down.

To make diamonds, well they are even dryer coal lumps, of course. gold will be made merely by condensing and drying sulfur, of course.

Merely 'messing up' the particles with a little electricity, to break them up, would result in mixed up particles. then, we send charges through them with a regulated electromagnet, to charge them to assemble in certain ways.

What I have learned about medicine.

Medicine is the most overrated discipline known to man! this is because i have mastered it, and, it is dead simple, and, here is a bit of what i have learned...

Inflammations are irritation. these come from dryness, as, there is no hocus pocus about biology. merely, your organ, known as the [x] has come into contact with something that has sucked the moisture out, like salt does, yes? this is because the skin is like a 'thin covering' that absorbs from both sides, of course. to 'cure this,' from tuberculosis to minor coughing - you know how a lubricant

like milk makes it easier? this is moisture and covers the throat in mucous style layers of 'lush liquids.' so, if you have a 'throat infection,' or even a genital infection, you need to moisturize that area, yes? dry to moist - the body needs balance. so, if it is a infection where there is lush moist stuff in your lungs, you need to dry that out with powder, as powder sucks up moisture, of course. these are easy so far, yes?

How about bacteria? these little living things infiltrate your body and feed off your fuels, as the body is their habitat, of course. to kill these, there are poisons that kill them, called anti boitics. these kill lots of things in your body except cells, which are selective in what they consume. then you take pro biotics.

In all instances of disease there are native and non native diseases. aids is non native, while cancer is native. cancer is rotten biomass that infect other biomass, of course, and aids hides inside you cells and spreads by quickly hijacking near by cells. these can be cured by, for cancer, observing that these cells are nearly dead, and, merely are like any contagious 'dying disease.' this means that you merely have to stop them from coming into contact with your other cells. let us observe radiation therapy? this is clumsy and messy, because it targets everything from your heart to your nerves - all of your body being subjected to harmful waves of 'dryness.' if that kills cancer, and it is supposed to, we should try to get the 'radiation' into the body and into those cells. of course, my idea for now, is to see these cells die faster, so they may not spread their old age leprosy to other cells, through 'relays.' then, there is hope to get the radiation to these areas, inside the bones where they grow old since birth. this means that you merely have to inject yourself with growth hormones, all over, to see the cancer grow older and mature faster, taking all the sting out of it.

For aids, your bodies white blood cells actually identify them as foreign cells. this means that the body fights it, but the disease 'hides inside the cells.' this can be rectified by collecting white blood cells together, or, penetrating the cells with the with mixing them with fuels - this is like a spring clean, yes?

Actually, i remember now that cyanide, found in apple seeds, could cure aids, as it is very poisonous to the individual cells, but not he whole body. they are classed as a fuel, as it is biomass inside the body too.

With mental ailments like retardation and down syndrome, we need to apply better working conditions to the brain it is thought. this is not true, as, they are merely lacking communication with the nervous system's communication pathways, not allowing the brain to communicate with the rest of the body. this means, for some people, the senses will be dulled, bringing a dulled message to the premotor cortex, processed incorrectly with noise, if you will, and then relaying this information to the understanding, language or left hand side of the brain.

So, if you were to observe that sometimes this is due to chromosomes, then you need to get rid of the extra chromosomes. this can be done by flooding the body with white blood cells, as, they will identify a irregularity in the body, as you are using someone else's chromosomes, which will mean the foreign cells, taken fro someone that is healthy, will take care of the things that are not part of it's d.n.a.

Then, there are other communication problems. if the brain is damaged, say it is not getting enough air, then you need to repair it. this is done because even a broken leg can be repaired, and that means a cell system or organ too can be repaired. this can be done by teasing the cells to react, as i doubt they are dead and black with decay. in the event they are dead and black with decay, merely applying growth hormones will make new cell systems or organs grow in the right place, as it is in the d.n.a. that 'the body' should be a certain way.

Then, there are deaf and blind people, and, lame people. teasing the cells and nerves, hard at first, as you need to shock them, like breathing in onions for blind people will make them cry, yes? this means that their cells will be shocked to their senses the same way you cause a ripple in a pond with a stone, of course.

Then, there is dismemberment. this can be rectified by observing that the body is just one egg cell that has grown. this means the information on how to grow is still with your body, but the instruction to grow has stopped.

We can re begin the process of limbs and digits regrowing by administering, cells to the liking of sperm in the body, or, on the outside. these sperm cells will instruct the egg cell - us - to grow, of course. sex hormones will also help, or, sexual aids like viagra. this will begin the growing process anew, and, the body will grow over a long time, from a fetus level, so using a cast could help for a while in the beginning.

Venus explained.

I have found through following venus, she has blessed me with a thorough understanding of the world. i have also found inner peace and joy in nearly everything that i do. in fact, i am so satisfied i feel i have no problems you could say.

This is because if you worship venus, and ask for abundance or quality she will probably give you both. being the second planet from the sun, she stands for the second attempt as in star wars and other common fantasy - you will notice a theme where the second round belongs to the good guys, yes? in any movie you watch, the second encounter is nearly always beneficial to the good guys, the second bomb in star wars or the second fight in the phantom menace, yes?

You could say this is like programming faeries. the more you repeat something, the easier it is to find and understand, like google searches are programmed to display regular common searches or so, or even teaching a child words, teaching them to write, and so forth. naturally, the first yield goes to the bad guys, like when the movie or book starts.

Some of you may feel that christ is the only way, or allah is the only way. this is because it has been repeated to you so much, like learning something. it is your 'root' and you dismiss everything else you hear as if it was someone saying their father earns more than yours, yes? this is because you have faith in someone that you hear about. but is this faith in people around you, or faith in the actual god - please consider this...

Then, there is the things that venus has blessed me with, namely my temperament and my reasoning. these have chiseled me so fine that i nearly always have an answer for something - if you were to light a candle and pray to venus, i am sure she will tell you the answers to your questions, even though you might not accept them. it is through accepting the answers you get that you will gain a grip on your life. if you are considering suicide, try this. why do you want to die - are you bored? this i bet is the most common theme for suicides that they are not satisfied with life.

Often i lie on my bed and am thankful for it - it is so apparent to me that it is lush luxury so easily accessible! this is because nearly everyone reading this has a bed, and, if you were to just lie there... well, imagine being without a bed... lie on the floor for ten minutes, try that? this will take your mind off the suicidal thoughts you might have, of course. in fact, if you are contemplating suicide, i want you to think of your favorite meal, and, imagine eating that again, just once - is that worth staying alive for?

So, venus is the 'good guys.' she endows people with inner peace and love, being the source of love for many of us out there, and she knows a heck of a lot too. if you are a student, light a candle close to you while you study and pledge the session to venus - the amount of focus you will have is incredible, i kid you not!

Now, to become a venetian you need only take her s your god. if you want things from her, ask honestly, if you are bored, serve her. remember when you were a little kid and you wanted to 'play servants' with the others, why not be a servant of venus? that will give you something to do. if i am not mistaken, she wants you to become a productive member of society, whether you are unhappy and seek drugs or something, or are a student looking to etch their way into the work force.

Now, some of you may ask "why venus over jesus or allah?" well, she will make deals with you - that gets your greedy little hearts beating doesn't it? then, she will bless you freely how she chooses, often showing you the way to prosperity or great fortune and joy.

I have given a lot of my time to venus. how often have you heard the pope say that he is a tool of jesus? he seldom says that at proclamations for his church, looking to it, i suppose, as a formality. i will honestly also say that i think that a lot of the christians out there have lost their way, am i correct? don't you feel empty and bored? this serving jesus could be fun, but i guarantee that serving venus will fill you with energy and vitality. this is because, i have noticed from the texts i have read, that jesus demands obedience and humility, something i give to venus without her expecting it, and she blesses me so.

As i said, i had a hunger for knowledge for venus. after i took her as my god, spoke with her, and prayed to her, she filled me with a different hunger than some other faiths have. let us take for example buddhism, this is about inner peace and finding your way in life, helping others and humility, yes? well, that is the way i interpret it, of course. venus on the other hand makes you hungry for success, and she supplies it - even my women friends that i started a business with have come to realize it was venus guiding us, supplying us with the questions she suggested, and the answers we found were guided by here too. imagine being filled with energy and laughter? you do know i laugh after i do something that she likes - she gets personal with us, of course.

So, why not someone else? well, if you were to compare the focus of muslims to venus, the muslims are regarded as "those that submit to allah," yes? allah has spelled out his wishes for his followers often, and, they never turn to athiesm or doubt god. so, what makes us doubt any god? when we are surrounded with these amazing trappings of the west, and watch movies or hear stories of 'evil powers' often christian nations will embrace them, yes? this is evident in nearly all christian countries, even accepting devil worship and allowing it to be celerbated. how can any loving god allow this - this tolerance is far from the family values that christ tried to manifest in all of us that heard his message, yes?

The way i see it;

[1] Chritianity is the values of forgiveness and peace, realizing that we are not perfect, not demanding this of others, and, humility in looking for and spreading this message that "god is great." of course, a god that doesn't answer prayers cannot be that great, as, there is no interaction between jesus and us at all at times, and, therefore benevolence is sorely sought, while you can still go to his heaven still by being forgive and forgiving others for your imperfections.

[2] Islam is about 'security.' this comes through having a strong family of love, loving the neighborhood, and loving the creator. then, there is security through intolerance of other gods,

securing the culture to be peaceful or ignore the world, while at the same time, giving them your ear if you give them yours. of course, this security is a little bit selfish, as it has no samaritans, except those that want to bring the greatness of their own god into the light, so it is like a north korea of religions - look at saudi arabia - they give more to culture and heritage than nearly any other country, and they are safe without crimes, with no homeless, with no poverty, yet do not spread their religion through missionaries, making them malevolent towards other cultures, even slandering them from fear of losing the love of their god.

[3] Venus is there for love and enjoying life. she likes to make people laugh and comedy, and is like a regular person. at the moment i am sure she seeks an identity, and i can only speak from my experience. she loves to spoil people, and, the only drawback is that she likes adultery, which she sees as 'harmless fun.' she likes life in excess you could say, and asks us to not kill and only not kill, while we must still embrace her in our prayers, longing to spoil those that pray with answers, like a teacher that shares everything, you could say.

So, with that of my mind in mind, i choose option three.

Now, i set forth a few challenges to prove to you you will be happier with venus than without her. these challenges are not requiring praying, but, rather just simple tasks - i understand that it is hard to accept something that western media makes fun of so often, yes?

If you have a diary, go and write about what this brett guy has been spewing! just spend half a page on it, the bug should bite you this is because when you are faced with something new, a third door if you will, you might be curious or you might be afraid, yes? if you were to observe that it is you speaking to yourself about what you personally think, regardless of what your peers think, something secret in pencil that you can rub out, or, something in ink that you can cross out, it will be your true feelings for this entity of love and laughter.

If you have a candle, why not simply stare into it ask what this brett guy is saying, it will calm you down, and the energy should influence you - hey, there are candles in christian churches too! this will draw the energy and warmth from the candle into your being through the heat of the flame, and, this flame is a active faerie. this means that, as venus is a fire element, that she will make you feel healthy and so forth, because she hears you think of her, and reacts! she reacts through electromagnetism, where your thoughts about this planet go at the speed of light to the planet venus, and the alpha and beta radiation bounces off the planet, in a different hole or crevice on the planet, and return to you, or, the candle to be more precise, as, the flame draws the electromagnetism as fuel for it to continue, as everything seeks to continue as long as it can. the 'ray' is running out of energy and sends this back, fluctuating a bit to reach the candle, as if it were a opposite charged magnet, or a branch of a tree that is on fire spreading looking for more fuel, yes?

Or, you might decide that you want to feel venus in the garden? this can be done by smelling roses, as venus is symbolized as a rose often, something used to signify love. it is through this repetition that languages form - merely repeating a word will make it a mainstream bunch of syllables, and, then there will be acceptance by the faeries, or, the one world consciousness that prevails in our world where there is reactions from certain particles to others. put it this way, if a rock slide occurs, it will make a 'objective noise,' - yes? - a noise that has no 'favor' with anything except for gravity. this means that 'noise' is objective, she will understand anyway you say it.

Warfare.

What would all these weapons be worth if you could not move them around quickly? artillery needs to be dragged around behind trucks to get them into position, and, tanks are slow and easy targets for rockets, of course.

Introducing an idea that the world has had for a long time - mecca. this is like a robotic launch pad for weapons, and, as i have figured from the forearms that get equipped with either weapons, mining equipment and farming equipment, besides the obvious advantages of building too, that can move easily through mountainous terrain even better than a person can and faster.

These mecca use hydraulics of the highest order - the toughest too - with legs that bend like a bird's legs to move around. the person or pilot sits in the cock pit of this more or less eight feet tall robot and 'pilots it.' with basic analogue sensors, they can find their way through any terrain, of course.

The problem is the reaction time. sure it can carry a lot, but, what about reactions for better control? i have found that it can react better than a person with sensors for each body part, as, each part is an extension of the pilots, basically. the robot will have 'hair' sensors to 'feel' each muscle tensing up, and react with nearly preempting the pilot's nervous system through 'electrical means.' this will make it super sensitive, and, reactive, of course.

Coated with graphene it will never get damaged by conventional means, and stand a hell of a chance in armed conflicts, easily carrying the wounded to the nearest medical point. interchangeable forearms will make it a slave bot for all times.

Now what we need is a 'plasma ball shield' to protect persons from damage due to normal and modern weapons. This will work with heat sensors of up to three kilometers or so - plenty of time to stop an attack - and launch energy at anything accelerating too fast, like a bullet or equivalent thing. this will be done with a moderate style heat sensor that picks up acceleration, or heat signatures of incoming attacks, and, launch a bolt of energy at them, detonating rockets and missiles, stopping natural things like lightning - on some planets we might mine, this could save a life! - and of course bullets and 'beams of light.'

The mechanism is to first identify and then, as soon as is identified, easily being processed by an i11 or equivalent or better analogue system, we could launch a 'plasma ball tendril' at the 'incoming' thing. of course, if it is a jet, it will have little effect on them, as they might just have a glitch with systems, and, we could program in a hailing frequency for the craft, set to a algorithm or password that deactivates the 'plasma ball.' the actual tendril will be like a e.m.p. weapon, firing a e.m.p. at the 'incoming thing' to stop it with magnetism.

Anti matter weapons are possible if we collect the anti matter on the outside of the atom or the inside of the atom in enough quantities to 'bond' with materials they hit. this is because they are suspended in the vacuum while they look for new matter to bond to, but, will destroy it if they meet it.

This collecting of matter is possible through a power ball of particles. the trick to get them to separate is to electrify the whole thing so it becomes unstable, then project it before it settles. this can be done with electric charge, like i said, in the center of 'the ball.' this will give it plenty of negative spin, and then it will destroy the tanks or what not that they are aimed at.

Maybe to get the charge we need to simply place a absurd amount of energy into a small space, then have the photons drag it forwards, so, it would require a lot of light and energy. this could be supplied by fusion and fission coming together, of course, as fission supplies lots of light, and fusion lots of energy, of course.

... of course, to get the fission, we need only have 'a light source.' this would require a few chemicals to come together for a moment, to provide 'the sun's energy.' just a lot smaller. this will provide the photon charge to carry the anti matter to the target, of course.

The chemical reaction coming from the fuel tank - so it will work on fuel that is slowly 'taken away' - will project a little bit of sun's energy at the target, much like a solar flare. we can shape and control this flare through mathematical means where we find the right angles for them to come together to 'shine' in the right direction, maybe 'encapsulating' it in nitrogen four so there is as little radiation as possible? there is no way that stuff will burn!

Then, to get the particles to separate, we need to only project the 'flare' as if to the power of so and such, to collect the anti matter stacked on top of each other. this is possible by separating the positive and negatively charged particles by, as i said, electrically charging the 'ball.'

Maybe we should just use fusion energy? this is the power of the sun, and, no doubt lets loose a flare of it's own accord. this would mean that the fusion power source could be going on in the back there, and then emits the photons necessary for travel. this would mean it is actually a fusion weapon, yes? of course, it could be better suited to releasing a stream of anti matter by using electromagnetism to emit a 'positive charge' through positive ions that will carry all the negative energy forwards?

Maybe we could carry a mass of negatively charged atoms by using electricity to carry it to 'a heat source,' like with the plasma ball, and then sending negative energy along these 'tendrils?' this will connect with the target through electromagnetism to keep it more or less on track, and then shoot the necessary things in particles or such to deteriorate and decay the target.

Biology.

The human body is a wonderful machine. it is made of organs, that are made of cells, that are made of molecules, that are made of atoms. these things all react as information is passed from nerve to nerve, making us 'one great reacting thing.' this means that the body merely reacts, so that means that there is no free will.

All of the cells in the body are organic. this means they are soluble with water, keeping fluids moving through our bodies, keeping the fuels held within fed and reactive through gas exchanges and liquid exchanges. there are also solids in the body called bones. these hardly react, as they are usually long and just there to hold the cells together and give motion to the body in the 'world of matter.' if our bodies were completely liquid, with gases flowing through them, then the body would have muscles, but nothing to grip onto, so, we could say our body's bones are like a tree branch for leaves.

Of course, the body is liquid and solid with gases keeping the body fed because the body needs to move around to get to it's food. this obviously came about by a molecule seeking a gas of some sort, then contracting like a muscle getting it's fuel it needed from the air around it. or, the history of life means that we would have had a molecule being formed from chemicals that had a mixture of cooperating things, that cooperated with gases, and then they sought more gases as time went on, as the relationship was beneficial for the liquid molecules.

The body is a regulator or 'debtor' on gases, and uses matter to project it forwards quicker. this means that the human body merely seeks gas as fuels, as it evident with the blood stream - no solids get out there, unless mixed with liquids to get the right things into the blood and to the cells. so, it is

chiefly for gases that the body yearns, then for liquids and matter too. these things go into the body to be taken from their natural state and processed into like things that suck all the nutritional atoms from 'the fuels' and then are taken to the parts of the body that need them, sort of like crushing a tablet for the powder inside, or a coconut sort of thing.

So, the body is also a big nerve made of smaller nerves. to see what really goes on, we need to merely touch one part of ourselves, and have that realized in the brain. this will show that the body is being gripped or influenced by something, and we will be aware of it. of course, due to certain conditions, we will always, given the same choice, choose the same thing again. this is because we have so many facets of ourselves influencing the choices we make that these override any choice we make.

If we were to observe that the body merely tries to survive, going from place to place to gain fuels, the overall drives of our body and instinct are fuel, sex and socializing. these three things govern our body to the extent we seldom think of anything else, and socializing is supposed to be where we 'gather to dominate' unless needs push us away. the sexual sector of ourselves is also because of dominance, as, we will seek to dominate the females, who are there to seek strength, so, we could say that weakness says we should seek strength, and male hormones say we should try to dominate the habitat.

With biology, we can observe the relay of information from the habitat to the organism known as the human being, of course. the habitat is also a nerve, or collection of nerves, that also react - this is like chemistry, where certain chemicals react to other chemicals in a certain way. this means that everything in our bodies and everything around our bodies is 'related,' yes?

Then, we could also say that the body, as alive as it is, has a lot of collected atoms into each cell, where the atoms collected in each cell will also react naturally with the rest of the chemicals in the body. each organ is made of chemicals too, as is every living and non living thing, of course. this means that the body works on reactions, and simply takes in fuels via reactions and excretes the poisons from the body.

Everything the body takes in is 'poison,' and, everything in our bodies is also 'poison.' the only way we survive is by killing these poisons or watching them expire and die, taking the life stuff from them, their actual things that give them life, into our bodies before they kill us. this is why we excrete poop and stuff - because all that stuff is toxic we poop out - it is the poisons of what is left from our bonding with the things we eat, of course.

Now, when it comes to diseases, we need to understand these are 'little people' coming to feast on our fuels. these diseases do not have the makeup to process these fuels themselves, so get us to do it for them, then eat our fuels. naturally, they eat a lot of other things we need too, so that is why we get sick. if you were to look at the tiny little things living in our hair or on our skin, they eat stuff without making us sick, and we don't mind, but with bacteria or viruses we see ourselves get into worse health, of course.

Then, we need to kill the bacteria or virus before it kills us! this means that usually our white blood cells will 'eat them' or bombard them with poisons to kill them, as they are like little police cells, yes? our bodies make them to kill the things that 'invade,' of course. these little things need to be killed or they will kill us. the process of making white blood cells is where our bodies take some of the poisons we process for food, and turn them into cells that flow through our bloodstreams to do just this protecting they do.

Why not look at the healing factors of the body? the body heals itself with warmth and blood - the blood flowing out becomes 'solid' and the 'warmth' keeps it nearly living and reactive to make more blood stop on the outside of the 'wound.' this warmth will dry the blood out and then force a scab or similar thing on our wound. this requires fuels to close, and, sometimes we see that our body changes in that area.

When cells stop reacting then there is a problem. they will stop due to links from the nervous system stopping signals to these cells, but, it is never supposed to. the while goal of the nervous system is to get all these nerves to communicate with each other, forming a total communication between each other for optimum reactions to take place. these reactions affect at least one other nerve and then that nerve affects another nerve, of course. when we feel pain, it is a reaction from the nerve to the brain, to register discomfort. then the body will take appropriate actions, actions we can overcome with a little determination, like drinking yuck medicine, of course - this is where our body tells us the medicine is not full of fuels so tells us it is 'gross,' wanting to stop it coming in, but, we can overcome this.

The body is also full of organs that do specific things, but, in the end, they are also just reacting naturally. let's look at the lungs? these are collections of 'membrane,' where they are like gross materials and liquid squishy stuff too, holding all the gases in them, as they are more dense than the gases, and then absorbing the gases they want by the gases densities. you see, oxygen and carbon are lighter than the harmful gases, and, the harmful gases are more like 'metals' and severely dense gases. when you drown, you take water into your lungs, which is much too dense to absorb for the lungs, meaning they will be harmed when they try to breathe the water out. this is because the lungs cannot process something this dense, nor get all of it out quickly enough, so it will smother the lungs with chemicals that are not 'light enough.'

Then, there is the heart. this collection of chemicals and membranes is there to pump blood through the body, to keep the blood moving. it needs to move because the blood carries fuels, and, the cells need to have an 'chemical electric charge' going through them to keep them reacting. so the heart is a product of the cells processing, and, the heart itself is there because the body needs to react with the heart absorbing the fuels and keeping itself fueled. the heart also needs fuels, so tries to attract them by pushing one way to get it from the other. it might be possible to have a creature without a heart, but the heart comes about due to genes, but the genes are there because of a very greedy organ that reverses it's feeding by pushing stuff out the way to get to the fuels.

So, we could say that organs are collections of 'tissue' that are made of 'cells' that perform a specific function for the body. do they know about each other though? i am sure they do not know about each other, as they merely do their thing to keep themselves fueled and in good health the way each cell in our body does. i mean, there is no central system that says they need to do this so that can do that, okay? they merely do what they need to, and, the brain will check that they are all working, being hte center of the nervous system.

The nervous system is there because of the brain 'reacting with them.' this brain we have sends them all signals that they do not understand as you might say, but rather signals to react in a certain way to certain things the brain interprets. the interpretations of the brain are there, as, if every organ is a parasite on the body, then the brain is a parasite on every organ, yes? this is because the brain would not work without fuels, much like everything else, but the brain is merely a decision maker, like the boss of a company, while the organs are there to do specific things for the brain.

It is obvious the body came to be the way it is out of necessity, because it collects cells to feed off the other organs, and these organs obviously started with the lungs and heart for gaseous exchange - something so base it must have been the first two organs to develop. then, the hormones came to be,

to reproduce, much like cell division. it is this cell division the body sees as very important that keeps us geared to have sex and reproduce, as it is the most active thing in our bodies after fuels and other intake. so, this sexual cell division drives us forwards, along with seeking fuels and dominance.

So, how do cells form tissue? if we were to be honest, there is no reason to form tissue other than to come together 'as a society,' much like we do in our lives, yes? this means that the tissue is formed by cells looking for like cells to reproduce with, like men seek women, and form families of tissue like organs the way we form families, of course. then, the tissue will start to react as a community, absorbing things to reproduce to form new tissue, with old tissue falling away to die, or dying and being 'processed out.' this dead tissue leaves your body the same way excess fuels from food do, but let's not get into that again, okay?

So, these families of tissue, or organs will start to beat, start to breathe, start to regulate or organize reactions. this tissue must be there to feed itself as a community, where as by itself it is swept from place to place in the blood stream. this means that each organ is made out of communities of like cells, or, cells come to rest near them and are influenced by their counterparts or friends to become like them, and slowly the heart forms in a human zygote or egg, of course.

Then, the organs form and the body will be able to move. bones come from tissue too, but this tissue is very dense, so does not really react. in fact, the bones we form are there because they are scared of moving, or, denser than the rest, maybe this is because of excess foods like calcium that are particularly thick? think of milk when you have a cold, how thick is that gross stuff that comes out of you when you sneeze? so, the bones come from excess fuels mixed with cells - some of the cells mix with the denser fuels and form inert bones - tissue that is not very reactive, while having cells inside them that really feel pain. the reason your bones get you more sore than your skin if touched is because they have never been touched before, of course.
